optimization theory is an active area of research with numerous applications many of the books are designed for engineering classes and thus have an emphasis on problems from such fields covering much of the same material there is less emphasis on coding and detailed applications as the intended audience is more mathematical there are still several important problems discussed especially scheduling problems but there is more emphasis on theory and less on the nuts and bolts of coding a constant theme of the text is the why and the how in the subject why are we able to do a calculation efficiently how should we look at a problem extensive effort is made to motivate the mathematics and isolate how one can apply ideas perspectives to a variety of problems as many of the key algorithms in the subject require too much time or detail to analyze in a first course such as the run time of the simplex algorithm there are numerous comparisons to simpler algorithms which students have either seen or can quickly learn such as the euclidean algorithm to motivate the type of results on run time savings

this volume contains the proceedings of the ams special session on algebraic and geometric methods in applied discrete mathematics held on january 11 2015 in san antonio texas the papers present connections between techniques from pure mathematics and various applications amenable to the analysis of discrete models encompassing applications of combinatorics topology algebra geometry optimization and representation theory papers not only present novel results but also survey the current state of knowledge of important topics in applied discrete mathematics particular highlights include a new computational framework based on geometric combinatorics for structure prediction from rna sequences a new method for approximating the optimal solution of a sum of squares problem a survey of recent helly type geometric theorems applications of representation theory to voting theory and game theory a study of fixed points of tensors and exponential random graph models from the perspective of algebraic statistics with applications to networks this volume was written for those trained in areas such as algebra topology geometry and combinatorics who are interested in tackling problems in fields such as biology the social sciences data analysis and optimization it may be useful not only for experts but also for students who wish to gain an applied or interdisciplinary perspective
