since the time our first book fault diagnosis in dynamic systems the theory and applications was published in 1989 by prentice hall there has been a surge in interest in research and applications into reliable methods for diagnosing faults in complex systems the first book sold more than 1 200 000 copies and has become the main text in fault diagnosis for dynamic systems this book will follow on this excellent record by focusing on some of the advances in this subject by introducing new concepts in research and new application topics the work cannot provide an exhaustive discussion of all the recent research in fault diagnosis for dynamic systems but nevertheless serves to sample some of the major issues it has been valuable once again to have

the co operation of experts throughout the world working in industry gov emment establishments and academic institutions in writing the individual chapters sometimes dynamical systems have associated numerical models available in state space or in frequency domain format when model infor mation is available the quantitative model based approach to fault diagnosis can be taken using the mathematical model to generate analytically redun dant alternatives to the measured signals when this approach is used it becomes important to try to understand the limitations of the mathematical models i e the extent to which model parameter variations occur and the effect of changing the systems point of operation

multidisciplinary scheduling theory and applications is a volume of nineteen reviewed papers that were selected from the sixty seven papers presented during the first multidisciplinary international conference of scheduling mista this is the initial volume of mista the primary forum on interdisciplinary research on scheduling research each paper in the volume has been rigorously reviewed and carefully copyedited to ensure its readability the mista volume focuses on the following leading edge topics fundamentals of scheduling multi criteria scheduling personnel scheduling scheduling in space scheduling the internet machine scheduling bin packing educational timetabling sports scheduling and transport scheduling

this book selects leading innovative and influential chinese maritime judgments and presents full translation of them with brief summary to the readers so that they can have insights of how the chinese maritime judges interpret apply and develop chinese maritime law in practice china trades with other states in trillions of usd every year and about 95 of the cargoes are carried by ocean going ships calling at hundreds of chinese ports each single day due to the enormous and steadily growing trade volume and shipping activities foreign ships companies and persons are often caught by the chinese maritime law and court the parties involved and their lawyers are more than ever enthusiastic to study chinese maritime cases in order to deal with their own cases properly or if possible predicate the potential problems and avoid the disputes outright the book is appealing to and benefits worldwide law students academics practitioners and industrial people in the shipping trade insurance and financial fields the book remedies to certain extent the situation that there is lack of authoritative sources available to foreign personnel to look into how chinese justice system functions

scheduling and multicriteria optimisation theory have been subject separately to numerous studies since the last fifteen years multicriteria scheduling problems have been subject to a growing interest however a gap between multicriteria scheduling approaches and multicriteria optimisation field exists this book is a first attempt to collect the elementary of multicriteria optimisation theory and the basic models and algorithms of multicriteria scheduling it is composed of numerous illustrations algorithms and examples which may help the reader in understanding the presented concepts

this is the second of a two volume series of books about fluoroplastics volume 1 covers the non

melt processible homopolymers requiring non traditional processing techniques volume 2 is devoted to the melt processible fluoropolymers their polymerization and fabrication techniques including injection molding wire tube and film extrusion rotational molding blow molding compression molding and transfer molding both a source of data and a reference the properties characteristics applications safety disposal and recycling of melt processible fluoropolymers are comprehensively detailed for immediate use by today s practicing engineering and scientists in the plastics industry students will benefit from the book s arrangement and extensive references

helicopters aircraft and missiles are just some of the practical multivariable control systems to which eigenstructure assignment has been applied in recent years liu and patton offer a uniquely integrated introduction to eigenstructure assignment theory and techniques for multi input multi output control system design features include introduction to the eigenstructure assignment toolbox for use with matlab examples available via the internet providing engineers with a powerful set of tools for the design of multivariable systems broad coverage including the principle of eigenstructure assignment basic insensitive robust and multiobjective eigenstructure assignment for multirate sampled data systems descriptor systems and fault detection systems description of the majority of known eigenstructure assignment methods for both state and output feedback control offering the reader a concise reference combination of time domain and frequency domain performance specifications for robust control design postgraduates and researchers studying control engineering will appreciate the combination of mathematical theory and practical issues control engineers particularly those working in the aerospace industry will profit from the detailed application sections which relate eigenstructure assignment to real industrial problems

we study haplotype reconstruction under the mendelian law of inheritance and the minimum recombination principle on pedigree data we prove that the problem of finding a minimum recombinant haplotype configuration mrhc is in general np hard this is the first complexity result concerning the problem to our knowledge an iterative algorithm based on blocks of consecutive resolved marker loci called block extension is proposed it is very efficient and can be used for large pedigrees with a large number of markers especially for those data sets requiring few recombinants or recombination events a polynomial time exact algorithm for haplotype reconstruction without recombinants is also presented this algorithm first identifies all the necessary constraints based on the mendelian law and the zero recombinant assumption and represents them using a system of linear equations over the cyclic group \mathbb{Z}_2 by using a simple method based on gaussian elimination we could obtain all possible feasible haplotype configurations we have tested the block extension algorithm on simulated data generated on three pedigree structures the results show that the algorithm performs very well on both multi allelic and biallelic data especially when the number of recombinants is small
