in recent years there has been a growing interest in the potential role that digital technologies can play in promoting well being smartphones wearable devices virtual augmented reality social media and the internet provide a wealth of useful tools and resources to support psychological interventions that facilitate positive emotions resilience personal growth creativity and social connectedness understanding the full extent of this potential however requires an interdisciplinary approach that integrates the scientific principles of well being into the design of e experiences that foster positive change this book provides an overview of recent advances and future challenges in positive technology an emergent field within human computer interaction that seeks to understand how interactive technologies can be used in evidence based well being interventions its focus of analysis is two fold at the theoretical level positive technology aims to develop conceptual frameworks and models for understanding how computers can be effectively used to help individuals achieve greater well being at the methodological and applied level positive technology is concerned with the design development and validation of digital experiences that promote positive change through pleasure flow meaning competence and positive relationships

first published in 1997 this study looks at the aspect of technological innovation that firms must constantly address if they are to remain viable concerns the chapters document key theories and ideas that have played an important role in the evolution of current understanding of how technologies change and how such changes come to be adopted by the market system hypotheses within a specific empirical context namely the pacemaker industry since its commercial beginnings in 1959 until 1990 how the various dependent and independent variables are constructed and finally the results of the empirical analysis

models are fundamental for estimating the possible costs and effectiveness of different policies for reducing greenhouse gas ghg emissions there is a wide array of models to perform such analysis differing in the level of technological detail treatment of technological progress spatial and sector details and representation of the interaction of the energy sector to the overall economy and environment these differences impact model results including cost estimates more fundamentally these models differ as to how they

represent fundamental processes that have a large impact on policy analysis such as how different models represent technological learning and cost reductions that come through increasing production volumes or how different models represent baseline conditions reliable estimates of the costs and potential impacts on the united states economy of various emissions reduction and other mitigation strategies are critical to the development of the federal climate change research and development portfolio at the request of the u s department of energy doe the national academies organized a workshop summarized in this volume to consider some of these types of modeling issues

featuring survey articles by leading economists working on growth theory this two volume set covers theories of economic growth the empirics of economic growth and growth policies and mechanisms it also covers technology trade and geography and growth and socio economic development

technological learning in the transition to a low carbon energy system conceptual issues empirical findings and use in energy modeling quantifies key trends and drivers of energy technologies deployed in the energy transition it uses the experience curve tool to show how future cost reductions and cumulative deployment of these technologies may shape the future mix of the electricity heat and transport sectors the book explores experience curves in detail including possible pitfalls and demonstrates how to quantify the quality of experience curves it discusses how this tool is implemented in models and addresses methodological challenges and solutions for each technology current market trends past cost reductions and underlying drivers available experience curves and future prospects are considered electricity heat and transport sector models are explored in depth to show how the future deployment of these technologies and their associated costs determine whether ambitious decarbonization climate targets can be reached and at what costs the book also addresses lessons and recommendations for policymakers industry and academics including key technologies requiring further policy support and what scientific knowledge gaps remain for future research

in this paper we study how aggregate output responds to the arrival of a new general purpose technology gpt by looking at adjustment mechanisms that operate through labor markets we show that under a wide set of circumstances the arrival of a new gpt that raises long run output can trigger a recession in the short run furthermore we characterize features of the gpt that produce a cyclical adjustment path an initial recession occurs

whenever a higher education level is required to operate the new gpt but a recession can also occur when the new gpt has lower educational requirements a cyclical adjustment path is more likely when inexperienced workers are less productive with the new technology and the faster productivity rises with experience in the new sector
